■ Automatic tortellini machine

- Technology and tradition linked together
- Maximum exploitation of the dough
- Quick and reliable format change/modular structure

we know pasta

AUTOMATIC TORTELLINI FORMING MACHINE

High capacity modular automatic machines for filled fresh pasta, which can produce tortellini and tortelloni following the manual technics and methods of the ancient emilian tradition. Easy usage and setting, filled pasta formats like handmade ones: these are Storci's filled pasta proposals.

Main technical features:

- Patented system for the exploitation of the dough sheet up to 90%, that enables to have an ever-fresh product and controlled quality, preventing scraps re-entry into the production process.
- Machine modular construction which guarantees a quick and reliable product format change, streamlining the production system (easy to set: format change takes place entirely substituting the central group and the filling loading group complete with dosing rods. All the mechanism controlling the phasing remain fixed to the mould, avoiding difficult regulations typical of standard cappelletti machines.
- Compared to the existing machines, there is a higher quantity of product on the same dough surface (up to 35%)
- cutting-edge filling injection system using a low pression thrust, so as to maintain the original quality features of the filling
- No pinch closing, only front closing according to the typical emilian traditional shapes
- Easy cleaning: the substitution in its entirety of the filling loading group simplifies the machine cleaning operations
